

International SIP Conference,
Paris, January 21, 2004

The Disruption Caused by SIP/IP in the Telecom Industry

Henry Sinnreich

MCI

* The opinions expressed here may or may not be those of my company

Outline

The integration of communications, applications and transaction

See the early birds

New services enabled by SIP

Endpoint versus network based services: Complexity that was not predicted

How to preserve the goodness of end-to-end

CPE complexity has not been predicted either

Most common errors made by traditional telecom vendors and operators

Telecom vendors cannot let loose of central control

New providers – new errors

IETF work on SIP – key directions

QoS on the Internet

Why the telecom disruption from SIP/IP is far from over

Integration of IP Communications with MS Office 2003

E-mail

Mail
Calendar
Contacts

Phone call
IM, voice, video
and data call

Office Phone
Conference

Integration: Siemens Openscape

The screenshot shows a web browser window displaying the Siemens Openscape Personal Portal. The browser's address bar shows the URL <http://165.218.91.82/UT>. The page header includes the Siemens logo and navigation links for Options, Help, and Logout. The main content area is divided into several sections:

- My Calls:** Includes a search for call numbers, a "Start conference" button, and a "Current Calls" section showing a device (Desk phone) in conference. A recent call log entry shows a call placed at 1:30pm to Jerome Davis.
- My Inbox:** Displays a list of messages. The first message is from Peter Rogers with the subject "Placement Machine Malfunction", received on Tue 2/11/2003 at 8:39 AM, with a size of 158 KB. The second message is from Bruce Walker with the subject "Problem at A B C Electronics", received on Mon 2/10/2003 at 3:16 PM, with a size of 2 KB.
- My Contacts:** Lists contacts including Bruce Walker, Moto Tachiri, Kim Song, and Nancy Arthur, each with icons for calling or messaging.
- My Calendar:** Shows a calendar view for Tuesday, February 25, 2003. A yellow event titled "My Birthday" is scheduled for 8 AM. A secondary calendar view shows the month of February 2003.
- My Collaboration Groups:** Lists groups such as Andys Team, ASP Development, Cebit, and Collab Team, each with a group icon.

The browser's status bar at the bottom indicates the current page is <http://165.218.54.13/exchange/sru/Inbox?fid: Important Enron Stock Holder Information.EML-5.EML>.

Get control of your time, your tasks and your communications

WLANS are home for SIP

The Value Proposition of IP Communication Services

Higher service resilience than PSTN – proven on 9/11/03 and 8/15/03 E.C. black-out,

More than one service provider – see above

Better voice quality than PSTN, new

Multimedia: Text, voice, video, data, new

Mobility for all communication services -new

Presence based services - new

Event based communications - new

Integration of voice mail, e-mail, IM, SMS

Multiple conferencing models and media - new

Call routing heaven + ENUM - new

Secure communications

User preferences and control for all of the above- new

Integration with the Web (new!):

Communication, information, productivity apps, entertainment, transactions

Gateways to PSTN, mobile telephony, paging networks, ISDN, H.323, etc.

100% open standards based, multi-vendor interoperable- new

Service development is easy and fast - new

Bottom line: Lowest overall cost and highest functionality combined

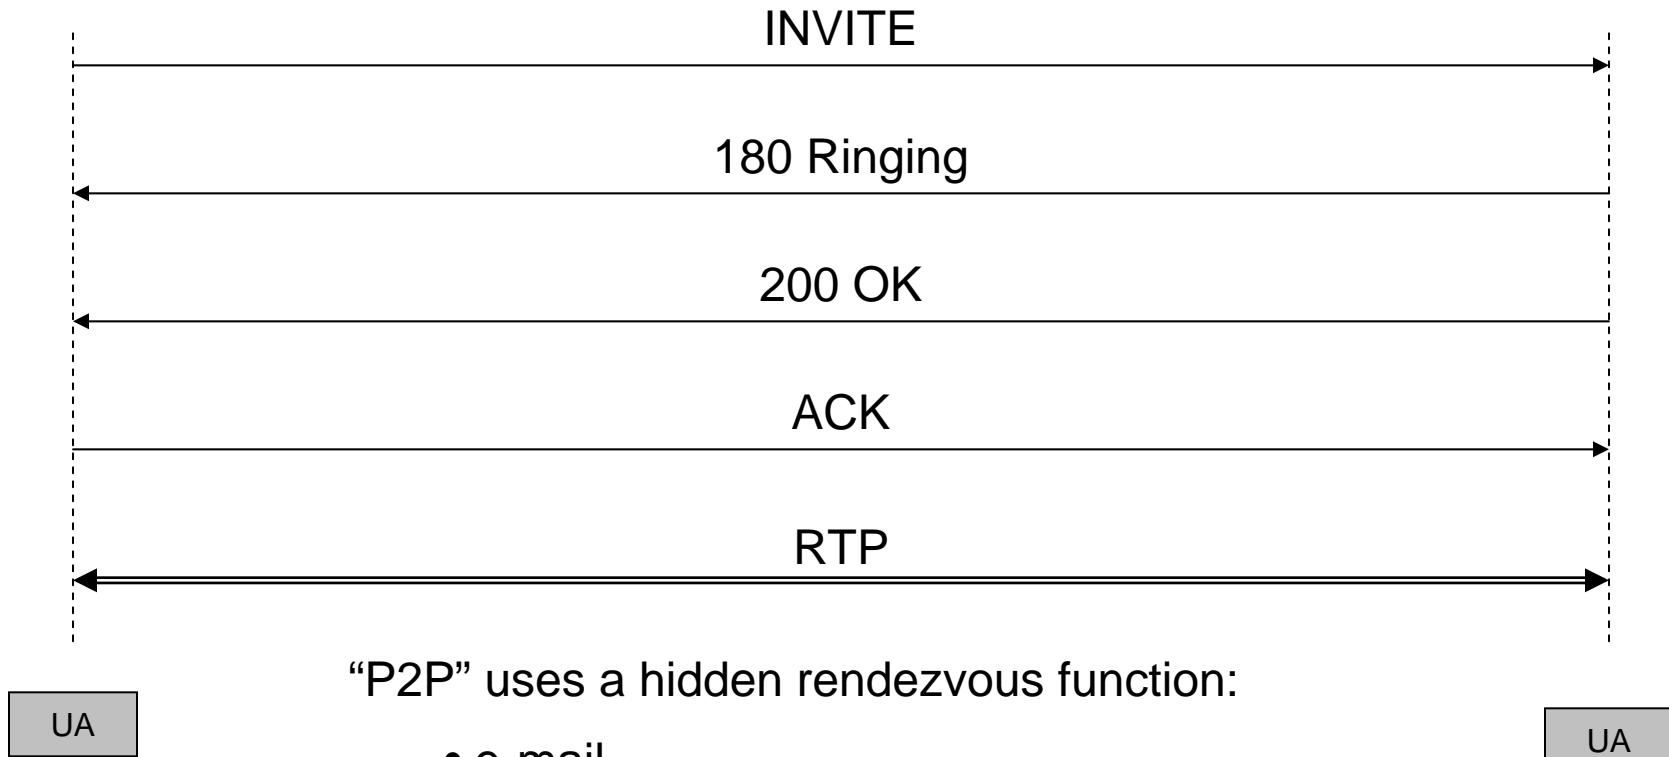

Endpoint versus Network Based SIP Services

SIP and Internet communications have quickly developed from the simple e2e model to multi-network and multi-application interoperability*

Is the complexity of Internet communications following the path of circuit based telecoms?

* Slides 7-17 were jointly developed with Alan Johnston/MCI

SIP started as Endpoint based e2e SIP and RTP

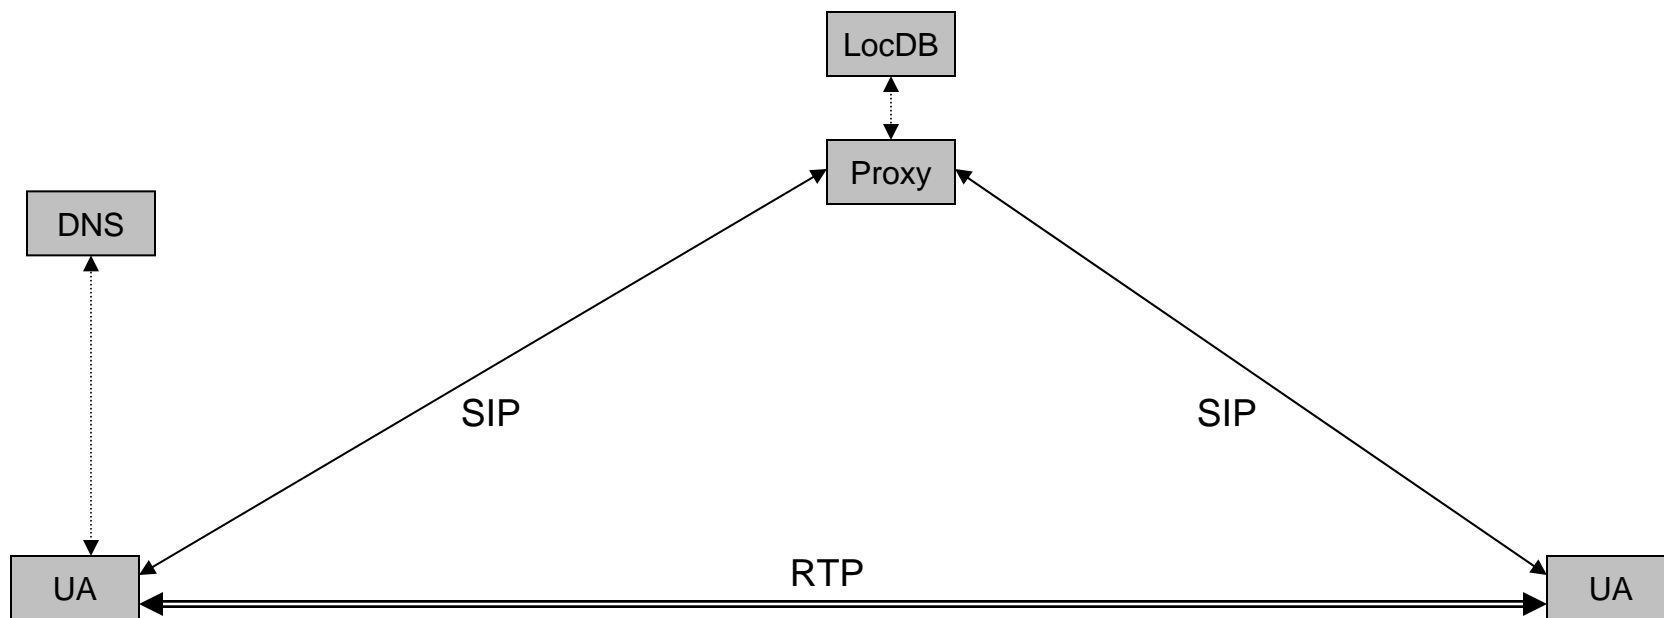

“P2P” uses a hidden rendezvous function:

- e-mail
- phone
- DNS
- some other server

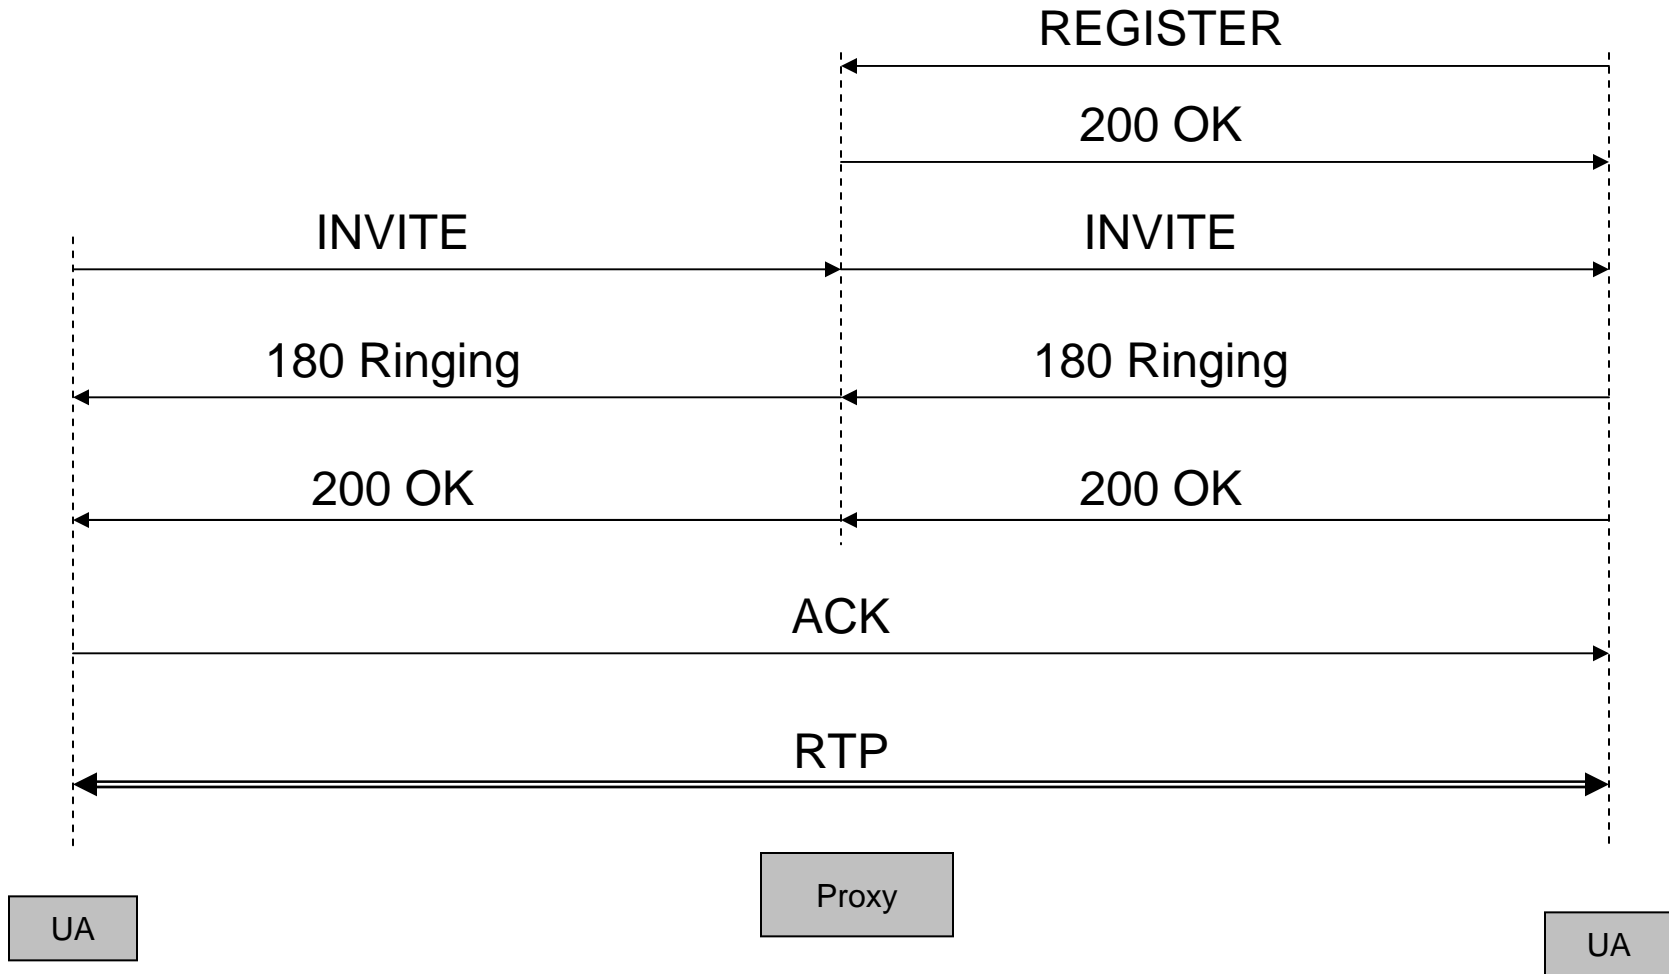

P2P is also not scalable, but is a nice try (Skype)

SIP Proxy Servers and REGISTER solve the rendezvous problem

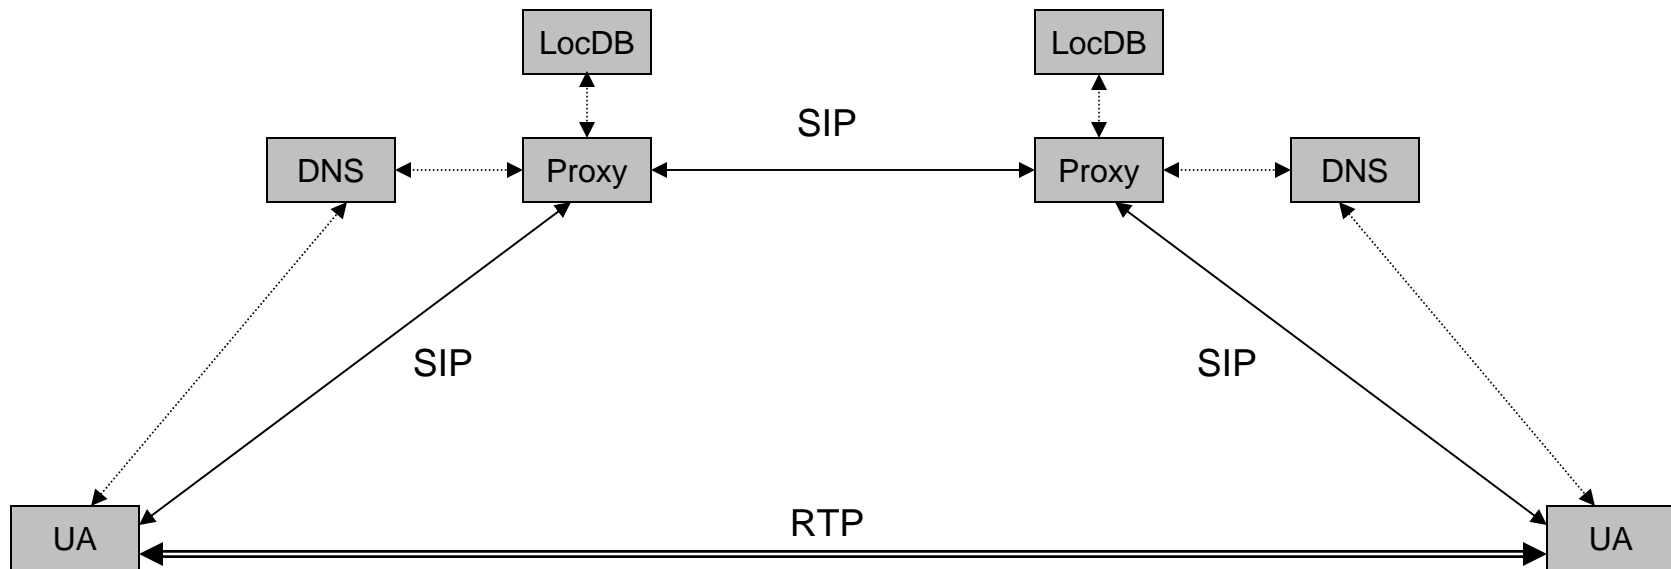

Endpoints register with a proxy server and use an AOR URI to reach each other.
Basic SIP allows proxy to drop out of dialog starting with the ACK

E2e with the help of a proxy server

Proxy does not keep call state information and does not stay in the signaling path starting with the **ACK**.

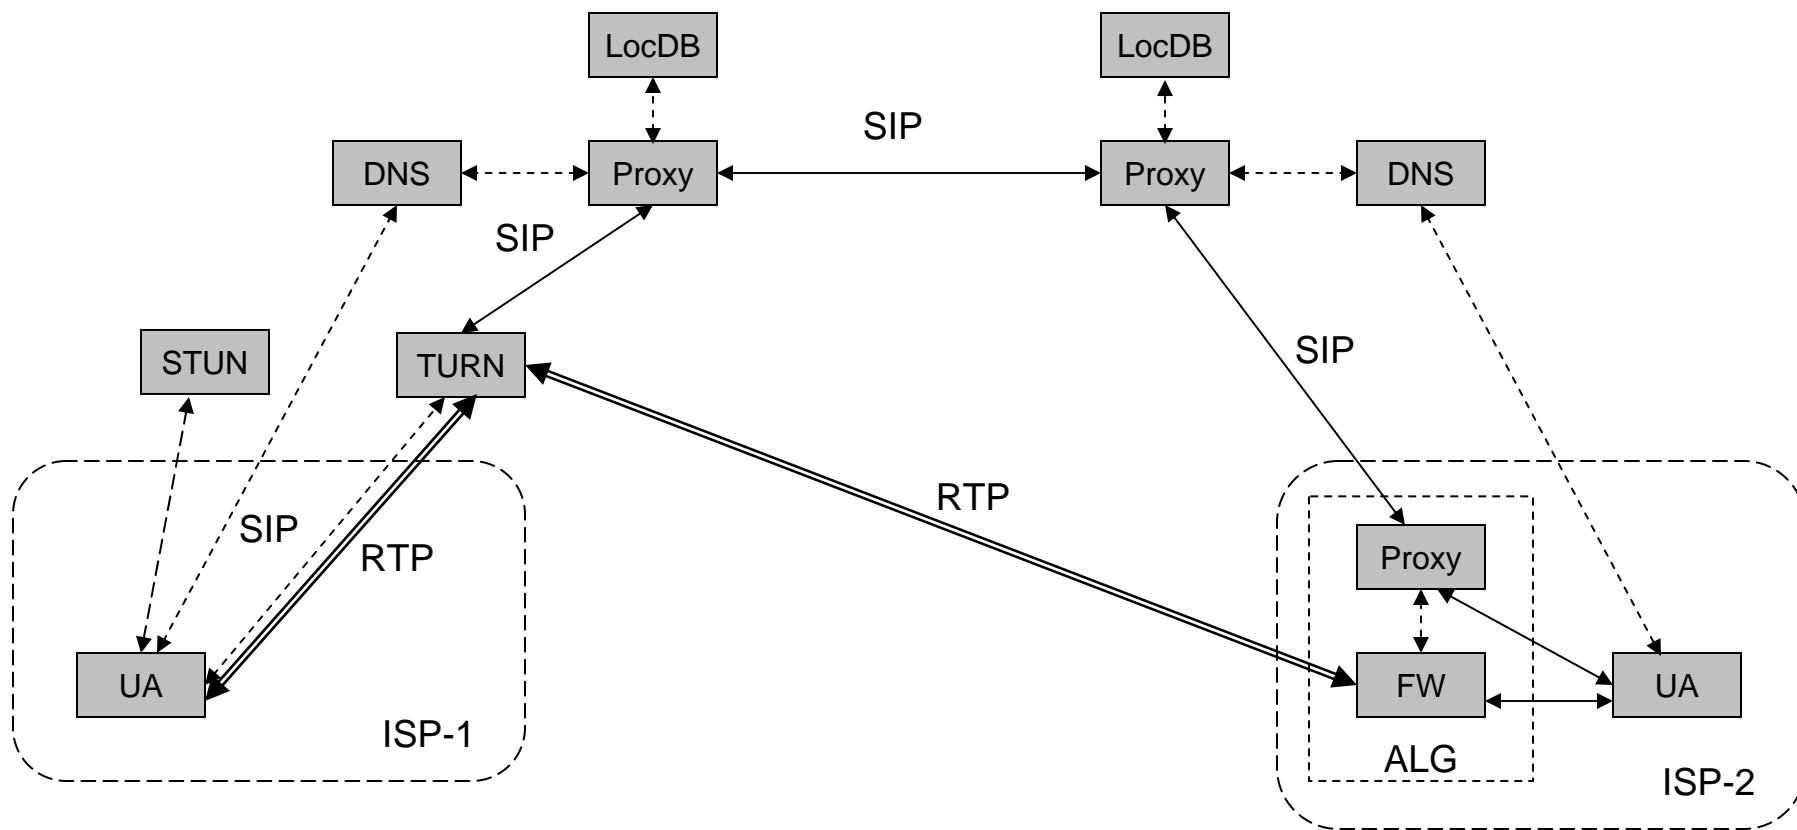

The SIP-RTP Trapezoid (RFC 3261) provides local control and service functions

Both proxies typically Record-Route in order to stay in the signaling path.

As long as Proxies obey RFC 3261 rules, SIP is still close to e2e (Proxies can be transaction stateful, not call stateful.)

Firewalls, NATs and local SIP proxies

Note: STUN and TURN servers are used for traversal of NAT in this ISP network

ALG is used for Firewall traversal in this ISP network.

Options for Firewall Traversal

ALG (B2BUA)

Breaks e2e

ALG terminates SIP session and re-originates the dialog

Can be separate from firewall.

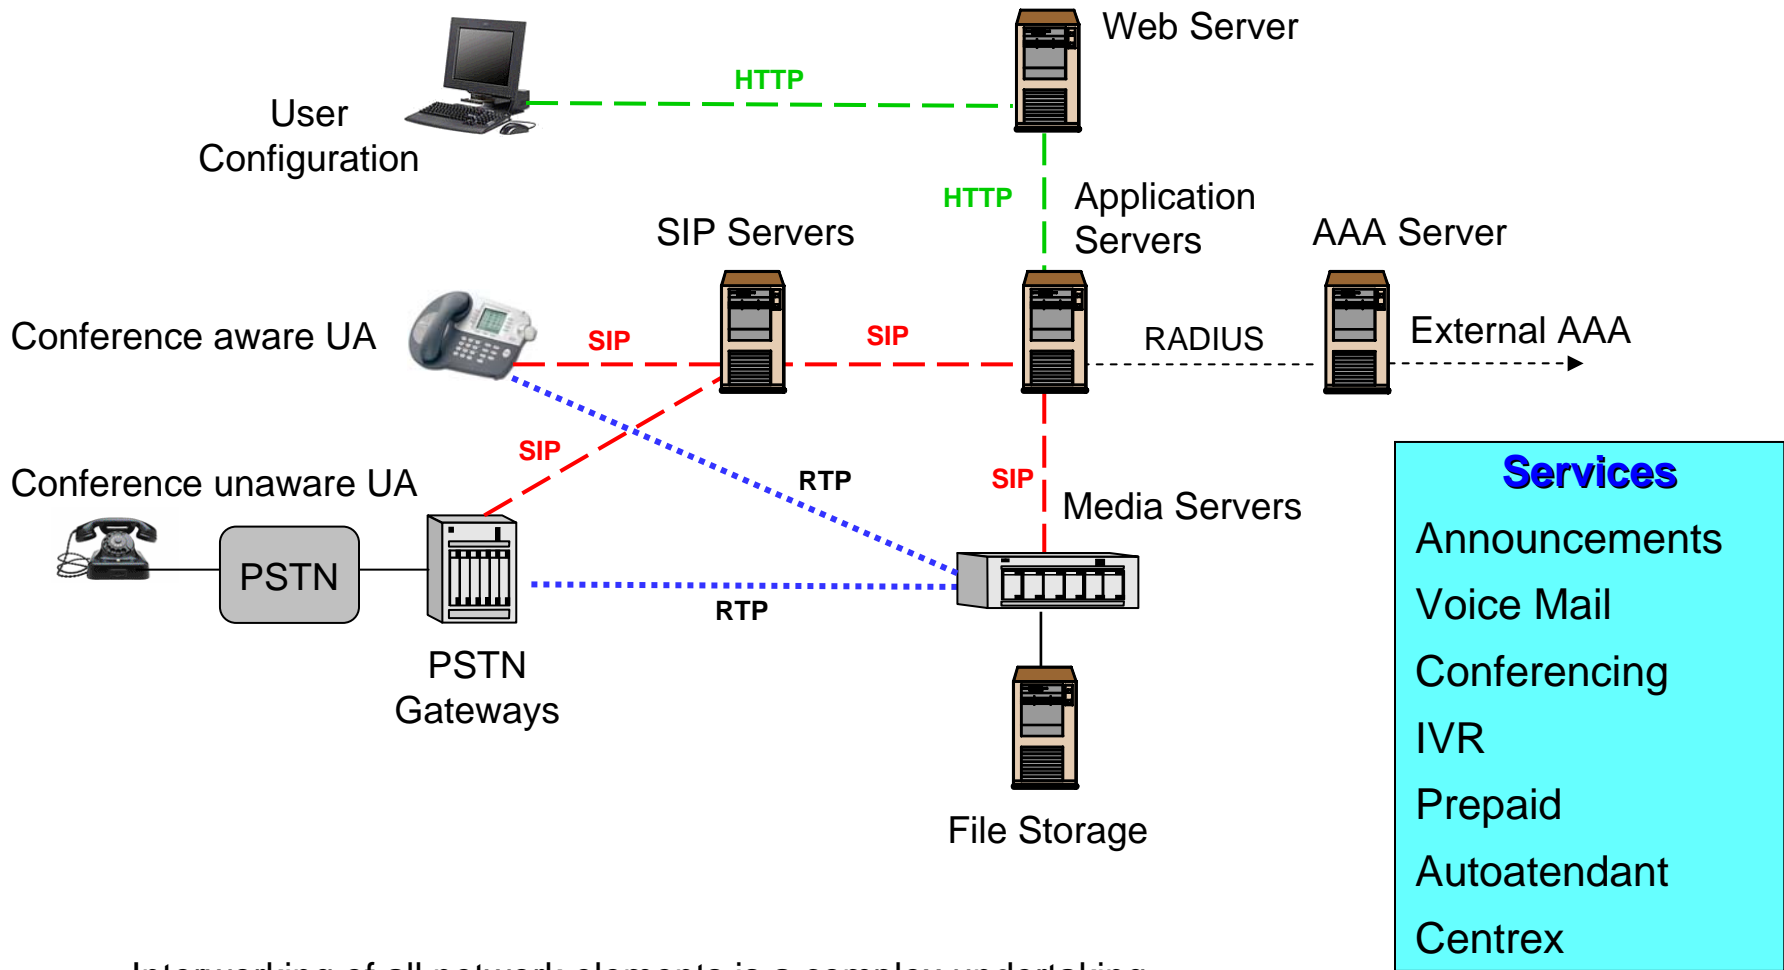

SIP enabled firewall proxy

Is close to e2e while still preserving security

Proxy authenticates and selectively opens “pin” holes for RTP media.

Needs MIDCOM protocol to separate from firewall.

Many service components support 'e2e' calls

Interworking of all network elements is a complex undertaking

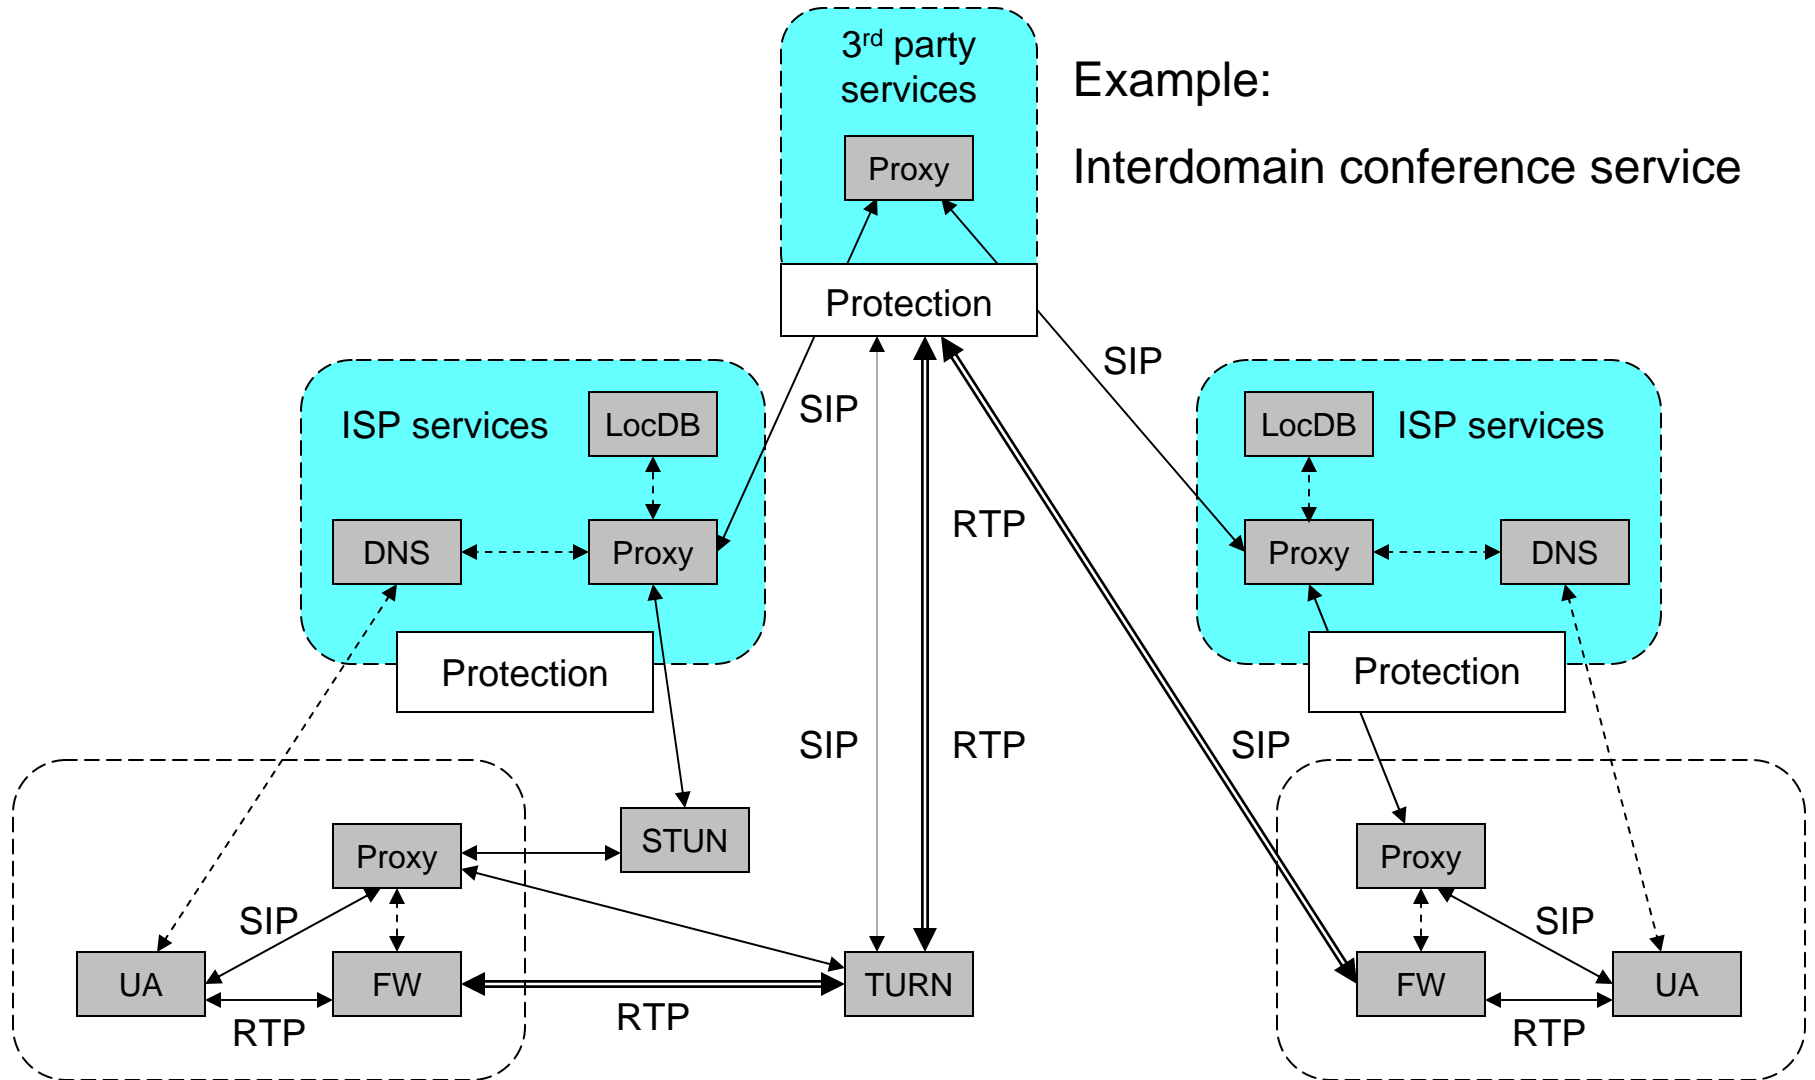

Strict adherence to standards makes the interworking manageable

New services and new network elements should require minimal regression testing

ISP and 3rd party services

Example:

Interdomain conference service

How to preserve the goodness of e2e

Why is e2e valuable?

- Flexibility at the edge
- Enables innovation
- Scalable
- Enables integration with local IT and personal apps. This can be done only at the edge of the network
- Prevents spam and telemarketing...

Design principles

- User has choice
- User has control

or

- Inform the user
- Get user consent
- Components, not closed bundles

These guidelines are valid for any type of Web/IP service and have been applied to all IETF SIP standards.

They characterize the difference between Internet communications and proprietary or H.323 or master-slave MEGACO/H.248 VoIP protocols.

Reference

“The Rise of the Middle and the Future of End to End: Reflections on the Evolution of the Internet Architecture” by James Kempf and Rob Austein. IAB, March 2003, work in progress.

<draft-iab-e2e-futures-01.txt>

Dilemma for ISPs: B2BUA AKA Session Controllers

Pros (especially the underlined)

Many useful functions

- Simplest FW/NAT traversal
- Centrex
 - Call park
- SIP-SIP peering
- SIP-H.323
- IP PBX peering
- Metering
- Policy enforcement
 - Routing optimization
 - Access control
- QoS
- Dial plans
- CALEA
- Anonymity
- Topology hiding
- BW compression
- QoS monitoring
- ...etc.,...

Lowest *initial* cost for all ISP business!

Cons

May block new service development

May not handle Presence, IM, video, etc.

If inside is compromised

- Telemarketing calls
- SPAM
- Theft of service
- Customer traffic data
- Customer voice (B2BUAM)
- Private IP addresses

Requires highest security environment

B2BUAWM requires double BW for ISP

Standards instead of B2BUA: Complexity

Function	IETF standards compliant approach
DHCP traversal	Dynamic DNS
NAT traversal	STUN, TURN servers, ICE, UPnP
Firewall traversal	SIP enabled firewall, UPnP
Centrex	draft-ietf-sipping-service-examples-05
SIP-SIP peering	SIP
SIP-H.323 peering	SIP-H.323 signaling gateway
IP PBX peering	SIP trunks
Metering	SIP session counting
Route optimization	SIP proxy
Access control	SIP proxy policy control
BW compression	RFC 2508, VAD in codecs
QoS	DiffServ on access link
Dial Plans	SIP proxy
CALEA	draft-baker-slem-architecture-02.txt
Anonymity	TURN, draft-dcsgroup-sipping-arch
Topology hiding	RFC 2543 Hide header field

B2BUA: Open Edge Pluggable Services WG

Inform: Services provided in the OPES framework should be traceable by the application endpoints of an OPES-involved transaction, thus helping both service providers and end-users detect and respond to inappropriate behavior by OPES components.

Consent: ...must include authorization as one of its steps, and this must be by at least one of the of the application-layer endpoints (i.e. either the content provider or the content consumer).

Reversible: In particular, services provided in the OPES framework should be reversible by mutual agreement of the application endpoints.

<http://ietf.org/html.charters/opes-charter.html>

Checklist for B2BUA's

Does it require application intelligence?

For existing applications (example: Centrex and conferencing)

For planned applications

Call flows compatible with the systems architecture

Interoperability testing with SIP proxies, gateways, telephony devices

Is the behavior well defined and testable?

Security Considerations*

Attack scenarios (DOS, silencing a client, stealing of identity, eavesdropping)

Compromising a B2UA: Risk assessment

Countermeasures

*draft-ietf-midcom-stun-04.txt

The Outlook for B2BUA's

For practical reasons, ISP's will deploy B2BUA's

Do Networks Operations have the call flows, timers, etc. to run the B2BUA?

Can new services be deployed without B2BUA upgrades? Non-voice?

Other new e2e transparency based services?

How can B2BUA's support SIP mobility?

The effect of low cost SIP enabled IAD's? SIP aware router/FW/NAT?

Intertex IX66 "SIP Switch"
Integrated Access Device

VoIP Gateway with Two Voice Ports

DVG-1120

*Share both Cable/DSL
modems and traditional phones*

D-Link

CPE complexity that has not been foreseen

Integration of complex CPE

- IP router
- Firewall/NAT/DHCP
- UPnP
- Dynamic DNS client on WAN side
- WAN link voice/data QoS policy
- WAN link voice priority (DSCP)
- SLA monitor (RTCP extension reports)
- Local priority for voice
- Ethernet hub
- 802.11x wireless access points
- 802.1x port authenticator
- Local SIP proxy/registrar (FW/NAT ctrl and mini-PBX)
- Local gateways to PSTN (FXO ports)
- Local gateway for PBX/key system (FXS ports)
- Message waiting indicator (MWI)
- T.38 fax and interactive text support (FXS ports)
- Emergency (911) support

No single product has all these functions at present

* This is a far cry from the ATM based “multi-service” switch pursued for many years by the legacy telecom industry and is a showcase example of its failure to plan technology development.

IETF SIP and SIPPING Working Groups

SIP System Architecture

- Multi-party call control with extensions
- Third party control BCP
- Content Indirection
- Globally Routable UA URIs (GRUU)

Innovations that will
change communications...

SIP Call Flows

- Basic
- With PSTN gateways
- Centrex/PBX style
- Bridged appearances**

Caller Preferences Extensions with multiple use cases

Intermediaries

- NAT traversal: ICE based on STUN and TURN
- End-to-middle security using S/MIME
- SIP identity inserted by intermediaries

Event architecture – is IP specific and Internet-wide applicable

- Dialog event package
- Message waiting indication event package
- Limiting the rate of event notifications

IETF SIMPLE WG: Presence

Presence Events

- SIP extension for publishing event state
- Event package for SIP
- Event lists for resource lists
- Presence specific event notification filtering

Presence data format

- XML based format for watcher information
- Rich presence information data format

Policy

- Simple presence publication requirements
- Presence data manipulation requirements
- Filtering of watcher information
- XML configuration access protocol (XCAP)
- XCAP for setting presence authorization

Efficient delivery of presence information: Requirements and use cases (for 3GPP)

SIMPLE for Presence and IM

Short list of objectives

Global-Internet wide standards based (no gateways)

Presence is a generic event for all applications

Same communication stack for all applications

Same global routing infrastructure

Same data sets and databases

Same servers

Same UAs as for other media

Same authentication, message integrity and privacy

E2E security, replay, DOS and other protections

Internet Conference Services

Integration of conferencing with calendaring and scheduling

Presence based conferencing

Change conference model and media ad-hoc

- Migrate from IM session to voice call

- Voice call to audio conference

- Voice conference to video conference

- A/V conference to collaboration through document sharing

All this without hanging up from the original call/session and while moving around between different end devices!

Distant learning – virtual classrooms

Advanced web call centers – multimedia with live agent

SIP for the hearing disabled is a special conference application

See XCON WG <http://www.ietf.org/html.charters/xcon-charter.html>

Telecom legacy errors

Are 'softswitches' and IP PBXs alternatives to SIP?

The proprietary IP PBX and softswitch are Internet unaware:

- Telephony-voice centric: PSTN & PBX emulations
- Services are unavailable outside of enterprise/ISP limits
- Central control
- Proprietary closed systems
- Ownership risk: There is no 2nd source for
 - phones
 - serversTraditionally designed to be not interoperable (some rare recent exceptions)
- Ownership cost: High for maintenance & custom development
- No standard presence
- No standard mobility

No integration with the web: Info, application, transactions

Single advantage: Turnkey systems

SIP Device Interoperability and Voice Quality

G.722 (and GIPS) 16 kHz sampling

Messenger video

Seen in Berlin

Seen in Richardson

HotSIP large video

The screenshot shows a 'Video Conference' window with a blue title bar. The main area is split into two video feeds. The larger feed on the left shows a man with a headset, identified as 'jiri'. The smaller feed on the right shows a man with glasses, identified as 'Henry Sinnreich'. Below the feeds is a 'Hang Up' button. The status bar at the bottom reads 'In conference session with jiri <sip:jiri@iptel.org>'. On the right side of the window, there is a control panel with sections for 'Speakers', 'Microphone', and 'I want to...' with various options like 'Send a File or Photo', 'Send E-mail', 'Ask for Remote Assistance', 'Make a Phone Call', 'Start Microsoft Portrait', 'Start Application Sharing', and 'Start Whiteboard'.

PSTN can be completely avoided

SIP Internet Voice Path: Dallas - Berlin

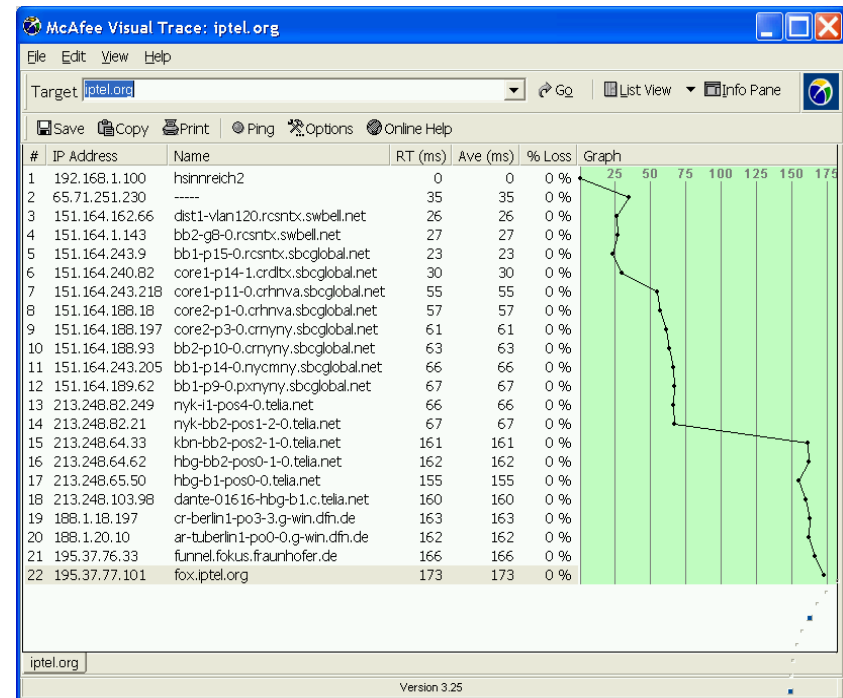

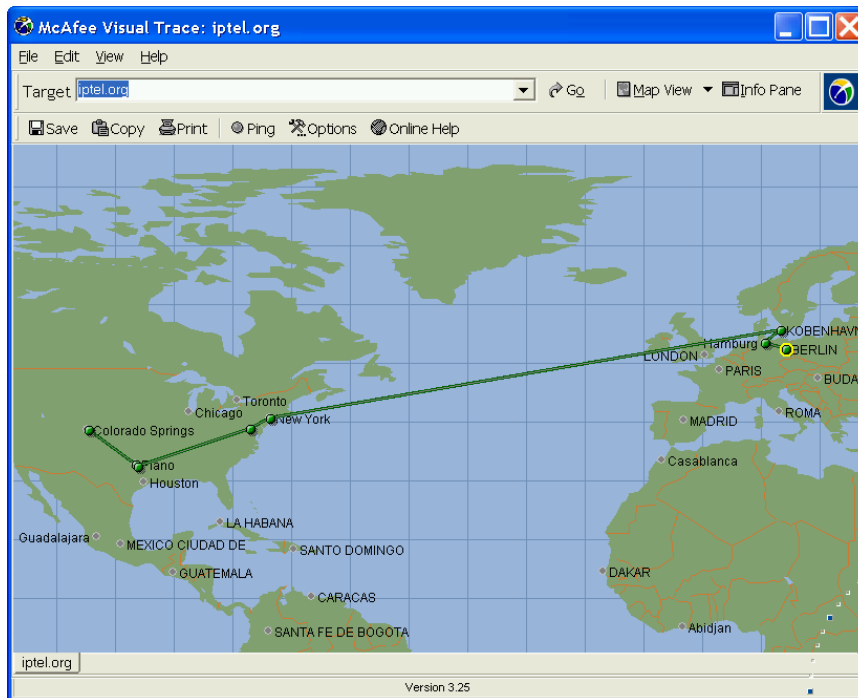

Better than PSTN voice on the Internet

Path traverses 4 public networks and 22 IP router hops

CD quality sound with HotSIP softphone and GIPS codec

Consistent quality for over a year of observation

Yokohama-Dallas is of similar quality as experienced at the 54 IETF meeting

Conclusion: SIP services work well globally on the Internet 'as is'

Single Internet Codec

(Internet standards are always better and license free)

The tests were performed by Dynstat, Inc., an independent test laboratory.
Score system range: 1 = bad, 2 = poor, 3 = fair, 4 = good, 5 = excellent

<http://www.ietf.org/internet-drafts/draft-ietf-avt-ilbc-codec-00.txt>

<http://www.ietf.org/internet-drafts/draft-duric-rtp-ilbc-01.txt>

Conclusion: Telecom disruption from SIP is far from over

Wireless surpasses wired telephony, 3G uses SIP, 4G is home for SIP

Largest carriers* (MCI, AT&T) consolidate all traffic on IP backbone

What happens to legacy networks (TDM, ATM, SONET) and telecom industry?

Regulation and taxation?

Mistakes: Rebuilding TDM over IP, who pays?

The impact of SIP has already started

The complexity of integrated SIP/IP communications, applications and transactions will fuel development for many years to come, see the early birds.
