## CS W3134: Data Structures in Java

Lecture \#11: Linked lists
10/12/04
Janak J Parekh

## Administrivia

- HW\#2 questions?
- enqueue / push / insert
- dequeue / pop / remove
- Yes, you can use what you dequeue!
- I'll put up HW\#1 solutions shortly - I have one situation to resolve
- Midterm next Thursday

## Agenda

- Linked lists
- Recursion, if time allows
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Linked lists

- Arrays are rather limited, cumbersome data structures - $\qquad$ cells are "fixed" together, limited length
- What if we could break apart the cells? $\qquad$
- We can!
- In fact, linked list-style structures are used more $\qquad$ frequently unless you need very fast random indexbased access
- Trees, graphs, etc. are generalizations of linked lists

## Linked List structure

$\qquad$

- Two basic objects: $\qquad$
- The list "parent" itself
- An "element" (book calls "link"), with data
- Technically, we don't need both
- Parent contains reference to the first element
$\qquad$
- Each element contains a reference to the next element $\qquad$
- Last element's "next" is set to null
- Meaning of the "." operator, reviewed $\qquad$
$\qquad$

## Basic Linked List operations

$\qquad$

- How to tell if empty? $\qquad$
- Insertions
- insertFirst()
$\qquad$
- deleteFirst()
- displayList)
- insertLast()
- More complex operations
- How to find an arbitrary element? $\qquad$
- How to delete arbitrary element?

## Doubling up

- Double-ended lists
- Contains pointer to last element
- Makes insertLast() much faster (how much?)
$\qquad$

Doubly-linked lists

- Keep a back (prev) pointer at every node $\qquad$
- Advantage: faster to go backwards
- Disadvantage: more memory and bookkeeping $\qquad$
- Be careful of syntax!
- What does last.prev.next $=$ null mean? $\qquad$
$\qquad$

## Linked list complexity?

$\qquad$

- Similar to arrays $\qquad$
- $\mathrm{O}(1)$ insert/delete at beginning (also end of list for double-ended)
- Other operations take $\mathrm{O}(\mathrm{N})$, but faster than array if "sliding" is needed in array
$\qquad$
- Memory? $\qquad$
- Linked list more efficient, although it has to keep lots of references $\qquad$
$\qquad$

## Revisit abstraction

- Book finally covers abstraction here $\qquad$
- We can redo all of our previous data structures, previously array-backed, as linked list-backed $\qquad$
- Interface - high-level contract, while the dirty details are hidden $\qquad$
- How to do a stack?
- How to do a queue? $\qquad$
- You should read through this section
$\qquad$
$\qquad$

## Other linked-list considerations

- Sorted List: how to do?
- Cases when inserting at beginning, middle, or end
- Sorting an unsorted List
- Insertion sort is faster than the other two sorts, since
"sliding" is very easy to do

## Iterators

$\qquad$

- With lists, frequently need to walk through a list $\qquad$
- Increase minimum wages of all employees, etc
- But there's no array index! How to step through? $\qquad$
- One way is to keep references to current cell, but requires "outsider" to know the internals of how the list $\qquad$ works
$\qquad$
$\qquad$
$\qquad$

## Iterators (II)

$\qquad$
$\qquad$
Structure: list, current, and previous references
Methods - book suggests:

- reset() - go back to beginning $\qquad$
- nextLink()
- getCurrent()
- atEnd() - last element, not after it
- insertAfter() $\qquad$
- insertBefore()
- deleteCurrent() $\qquad$
$\qquad$

## Iterators (III)

- Java has its own, simpler, Iterator, with next() $\qquad$ and hasNext(), and that's it
- Supports more than linked lists $\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Iteration vs. Recursion

$\qquad$
$\qquad$
So, what is iteration, anyway?

- Dictionary.com: "The process of repeating a set of instructions a specified number of times or until a specific result is achieved."
- Any other way of repeating over and over?
- Well, let's think about it...
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## How to calculate...

- What's the sequence 1, 3, 6, 10, 15, 21, 28,
$\qquad$ 36...
- Triangle numbers
- How to do as loop?
- How to do as addition on previous result?
- Recursion!
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
